Trusted Advance Wound Care Solution

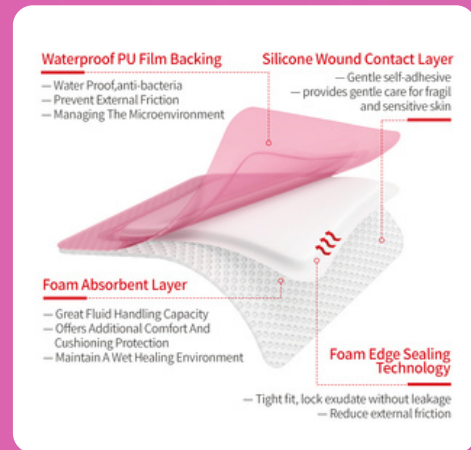

Silicone Foam Dressing With Border

Size: 10cm x 20cm, 10cm x 25cm

Color: Pink, Skin

How Do Silicone Dressings Work?

Silicones are long-chain polymers that contain repeating chains of silicone, oxygen, and other elements. They have a hydrophobic soft silicone layer that is tacky to touch, preventing the dressing from sticking to the wound but still enabling it to adhere to the surrounding skin. This helps to minimise patient trauma during dressing changing.

Help mothers heal with an advanced dressing

The initial days post C-section are crucial for the ongoing well-being of the mother. Clinicians play a pivotal role in ensuring a smooth recovery by carefully choosing the incision dressing. To balance standard care and enhance outcomes, medical teams should explore advanced dressings for C-section incisions. These specialized dressings not only shield the incision but also offer flexibility, absorption, easy removal, and technology aimed at preventing surgical site infections (SSIs).

5 Advantages for C-Section Incisions.

1. Flexibility - promotes early mobility without adding tension to the incision.
2. Protection - Minimizes healing interference & dressing related skin damage.
3. SSI Risk Reducing - creating a protective barrier, maintaining optimal moisture levels, and incorporating antimicrobial properties to inhibit bacterial growth.
4. Shower Proof - Allows for bathing and cleanliness.
5. Absorption - Ensure proper moisture balance necessary to healing.
